

Waterfall Model Documents

Document 1- Business case document template

Why is this project initiated?

This project was initiated to address several critical operational gaps in the current B2B customer support process. The primary reasons for initiation include:

- **Fragmented Support Channels:** B2B issue resolution is currently scattered across disconnected communication channels.
- **Operational Downtime:** Fragmentation leads to high downtime for clients.
- **Communication Gaps:** There is a significant delay in communicating status updates and critical information to C-level stakeholders.
- **Need for Centralization:** The organization requires a unified platform to integrate multi-channel support, automated root cause analysis, and JIRA tracking to reduce resolution time and case backlog.

What are the current problems?

The current environment system is facing several critical challenges that have necessitated the initiation of B2B CRM platform.

1. Fragmented Communication Channels

B2B customer support is currently managed through disconnected channels such as manual email chains and independent chat tools. This lack of a unified interface makes it difficult for support teams to maintain a single, cohesive case history.

2. High Operational Downtime

Because the resolution process is scattered, there is a significant delay in identifying and fixing issues. This fragmentation directly leads to high downtime for B2B clients, which can be extremely costly for high-level stakeholders.

3. Lack of Real-Time Visibility

There is a significant communication gap between the support team and C-level stakeholders. These stakeholders often lack real-time visibility into the status of their cases, leading to a loss of trust and the perception that issues are stalled or "lost."

4. Manual Handover and Technical Debt

The process of transferring technical issues from support to engineering is currently manual. This results in:

- Data Entry Errors: Inaccuracies when moving information from support logs to JIRA.
- Lost Cases: Issues falling through the cracks during the handover.
- Growing Backlog: A lack of automated synchronization between platforms prevents the efficient clearing of technical debt.

5. Lack of Proactive Analysis

Currently, the team is in a "reactive" state. Without a dedicated Root Cause Analysis (RCA) engine or integrated data analysis from tools like ReTool, the team fixes symptoms rather than underlying problems, leading to the recurrence of the same issues.

6. Documentation and Knowledge Silos

Information regarding troubleshooting guides and product features is not centrally maintained or easily accessible. This leads to support agents spending extra time looking for information, which further delays resolution times.

With this project how many problems could be solved?

The project addresses four primary problem categories that currently hinder the organization.

1. Communication & Stakeholder Management Gaps

- Solved by: Multi-Channel Customer Support, Reporting & Insights Dashboard.
- The Problem: Currently, communication is fragmented, and C-level stakeholders lack visibility into issue status.
- The Solution: By providing dedicated chat, email, and video channels alongside real-time dashboards, the project ensures C-level stakeholders are no longer "left in the dark." This bridges the visibility gap and restores professional trust.

2. Operational Inefficiency & Manual Errors

- Solved by: Case Management System, JIRA Ticket Integration, Knowledge Base Management.
- The Problem: Issues are lost during manual handovers between support and engineering; agents waste time searching for troubleshooting steps.

- The Solution: Automation ensures 100% accountability. JIRA integration removes "human error" from ticket creation, while the Knowledge Base provides a "Single Source of Truth," reducing the time agents spend searching for answers.

3. Reactive vs. Proactive Problem Solving

- Solved by: Root Cause Analysis Engine, Internal Tool Data Analysis, Process Optimization Module.
- The Problem: The team currently fixes "symptoms" rather than "causes," leading to recurring technical issues and high Mean Time to Resolution (MTTR).
- The Solution: By analyzing data from tools like ReTool, the project identifies why problems happen. The Process Optimization module identifies bottlenecks in the Waterfall workflow, allowing the team to streamline operations and prevent issues before they reach the customer.

4. Talent Management & Performance Tracking

- Solved by: Team Collaboration & Training Support, Performance Monitoring.
- The Problem: Onboarding new hires is slow, and there is no clear way to measure individual or team success against KPIs.
- The Solution: Integrated training reduces the team backlog by getting new hires productive faster. Performance monitoring provides management with the data needed to track KRAs (Key Responsibility Areas) like resolution time and customer satisfaction, ensuring the project meets its SMART objectives.

What are the resources required?

The resources required for ResolveSphere are categorized into four key areas:

1. People (Human Resources)

- Project Team: A specialized team including a Project Manager, Developers, Testers, and Business Analysts.
- BA Allocation: Following industry standards, Business Analysts should comprise 12-16% of the total team size.
- Labor Cost: Budgeted at Rs. 4,50,000 to cover professional man-hours for this "Medium to Large" scale project.

2. Hardware & Infrastructure

- Workstations: High-performance laptops specifically for the development team to handle integration and coding tasks.
- Hosting: Dedicated server space required for internal tool hosting and maintaining a "Staging Environment" for testing before the final rollout.

- Equipment Cost: Estimated at Rs. 2,00,000.

3. Applications & Development Software

- Modeling Tools: MS Visio for creating UML diagrams (Use Case and Activity diagrams).
- Tracking & Analysis: JIRA for ticket tracking and ReTool for operational data analysis.
- Development Environments: IDEs and API middleware licenses necessary for the JIRA and Internal Tool integrations.
- Software Cost: Estimated at Rs. 1,00,000.

4. Research & Evaluation

- External Data: Third-party software evaluations and Dataquest reports (company's internal reporting engine) to ensure the platform stays aligned with B2B market trends.
- Field Work: Site visits to understand the current legacy system's pain points firsthand.
- Research Cost: Capped at Rs. 50,000.

How much organizational change is required to adopt this technology?

Adopting ResolveSphere's B2B CRM software requires a moderate to high level of organizational change because it moves the team from a fragmented, "tribal knowledge" environment to a structured, data-driven workflow. Based on the project documents and Waterfall methodology, the change can be broken down into three key areas:

1. Process Transformation (Waterfall Alignment)

The most significant change is the shift from ad-hoc, manual communication to a sequential, documented process.

- Standardization: Support agents must move away from personal email chains and adopt the Case Management System for all interactions.
- Formal Handovers: The engineering team must adapt to receiving automated JIRA tickets rather than informal requests. This requires following a strict lifecycle where requirements are locked before development begins.

2. Shift to Data-Driven Culture

The introduction of the Root Cause Analysis (RCA) Engine and Internal Tool Data Analysis (ReTool) requires a shift in mindset:

- Reactive to Proactive: Instead of simply "closing tickets," the team must now participate in RCA sessions to identify underlying patterns.
- KPI Accountability: With Performance Monitoring (KRA & KPI) features, there will be higher visibility into individual and team metrics (like MTTR), which may require a shift in management style and performance reviews.

3. Stakeholder Communication Protocols

The Multi-Channel Customer Support feature changes how the organization interacts with B2B C-level stakeholders.

- Formalization: Communication will become more transparent and structured through the Reporting & Insights Dashboard. This requires the support team to be more diligent in data entry, as their reports are now directly visible to high-level clients.

4. Mitigation of Resistance (The "Learning Curve")

As identified in your Risks & Dependencies, the current legacy system has been in place for years and is intuitive to users. To manage this:

- Training Support: Significant effort is allocated to Team Collaboration & Training Support (Functionality 8) to reduce the team backlog during the transition.
- Documentation: The Knowledge Base Management module will serve as the transition's "Single Source of Truth," helping users navigate the new 10-feature platform.

Time frame to recover ROI?

The time frame to recover the Return on Investment (ROI) for the ResolveSphere project is estimated at 12 to 18 months post-implementation.

In a Waterfall project, ROI is not realized during the 6-month development phase, but rather begins once the system is "Live" and operational. The recovery is calculated based on the following value drivers:

1. Productivity Gains (Months 1–6 Post-Live)

The primary source of early ROI comes from reducing the Mean Time to Resolution (MTTR). By automating JIRA ticket creation and using the Knowledge Base, support agents save significant man-hours. If the platform reduces resolution time by the targeted 20%, the organization begins saving on operational overhead almost immediately after the training phase is complete.

2. Cost Avoidance (Months 6–12 Post-Live)

The Root Cause Analysis (RCA) Engine identifies underlying technical issues. By fixing a problem once at the "root" instead of patching symptoms repeatedly, the organization avoids the cost of recurring support tickets and technical debt. This "preventative" saving is a major contributor to recovering the initial Rs. 8,00,000.00 investment.

3. Stakeholder Retention (Months 12+ Post-Live)

For a B2B platform, the most significant ROI is Customer Retention. Reducing downtime for C-level stakeholders directly prevents "churn" (clients leaving for competitors). Retaining even one high-value B2B contract that might have been lost due to poor support visibility can often cover the entire project cost in a single renewal cycle.

How to identify Stakeholders?

To identify stakeholders, a structured process needs to be followed to ensure that all individuals or groups who can affect or be affected by the platform are captured. Here is the step-by-step approach:

1. Review Project Initiation Documents

The first step is to analyze the Project Charter or Business Case. These documents usually list the Project Sponsor, Project Manager, and the high-level departments involved.

2. Use Elicitation Techniques

- Brainstorming: Meet with the Project Sponsor to identify who currently handles B2B support and who uses the JIRA and ReTool systems.
- Interviews: Conduct one-on-one sessions with department heads to understand which teams interact with C-level stakeholders.
- Document Analysis: Review existing organizational charts and process maps for the "As-Is" support workflow to see who touches a customer case from inception to resolution.

3. Stakeholder Categorization (The 4 Categories)

Stakeholders are generally grouped to ensure no one is missed:

- Users: Support agents, technical account managers, and customer success teams.
- Suppliers/Partners: Engineering teams (managing JIRA) and internal tool developers (managing ReTool).
- Beneficiaries: B2B C-level stakeholders who receive the reporting and insights.

- Decision Makers: The Project Sponsor and the Change Control Board (CCB).

4. Analyze the Stakeholder Matrix (Power vs. Interest)

Once identified, stakeholders are mapped on a matrix (Thomas Kilmann Conflict Model) to determine how to manage them:

- High Power / High Interest: (e.g., Project Sponsor, C-level clients) Must be managed closely.
- High Power / Low Interest: (e.g., Legal or Compliance) Must be kept satisfied.
- Low Power / High Interest: (e.g., Support Agents) Must be kept informed and trained.
- Low Power / Low Interest: (e.g., General internal staff) Monitored with minimal effort.

5. Identify Based on Functionality

For ResolveSphere specifically, we identify stakeholders by looking at 10 key functionalities:

- Who manages the Knowledge Base? (Content Creators/Support Leads)
- Who defines the KRAs & KPIs? (Operations Management)
- Who provides the data for RCA? (Data Analysts)

6. Documentation

All identified individuals are recorded in the Stakeholder Register, which includes their names, roles, contact details, and their specific requirements for the project. This ensures a "Correct, Complete, and Consistent" foundation for the Waterfall requirements phase.

Document 2: BA Strategy

Write BA approach strategy:

As a business analyst, what are the steps that you would need to follow to complete a project:

1. What Elicitation Techniques to Apply

To ensure requirements are "Correct, Complete, and Consistent," a combination of techniques will be used:

- Interviews: One-on-one sessions with C-level stakeholders and Support Leads to understand high-level expectations and pain points.

- Document Analysis: Reviewing existing "As-Is" support logs, JIRA tickets, and ReTool data exports to identify current gaps.
- Brainstorming: Group sessions with the technical and support teams to identify the 10 key functionalities.
- Observation (Job Shadowing): Watching support agents handle a live B2B case to identify manual bottlenecks in the current process.
- Interface Analysis: Examining the touchpoints between the current support tools and JIRA/ReTool to define integration requirements.

2. How to do Stakeholder Analysis (RACI/ILS)

Stakeholders are analyzed to determine their level of influence and responsibility:

- RACI Matrix:
 - Responsible: BA, Developers (Performing the work).
 - Accountable: Project Sponsor (The one who signs off).
 - Consulted: Support Team, Engineering (Providing functional/technical input).
 - Informed: C-level Stakeholders (Kept updated on progress).
- ILS (Influence, Latent, Salience): Used to identify "Salient" stakeholders who have the power, legitimacy, and urgency to impact project decisions, ensuring their requirements are prioritized.

3. What Documents to Write

Following the Waterfall deliverables, the BA is responsible for:

- Business Case Document: Defining the Situation, Problem, and Opportunity.
- BA Strategy Document: Outlining the approach, elicitation plan, and timelines.
- Business Requirements Document (BRD): High-level business needs and goals.
- Software Requirements Specification (SRS): Detailed functional and non-functional requirements (FURPS).
- Use Case Descriptions: Detailing the interaction between actors (Support Agents/Clients) and the system.
- Requirements Traceability Matrix (RTM): Mapping requirements to design and test cases.

4. What Process to Follow to Sign Off on the Documents

1. Internal Review: Peer review within the BA team to check for consistency.
2. Technical Review: Review with Developers and Architects to ensure technical feasibility (especially JIRA/ReTool integrations).

3. Stakeholder Walkthrough: Presenting the document to the business owners to ensure their needs are accurately captured.
4. Final Formal Review: Distributing the final version for a formal sign-off.

5. How to Take Approvals from the Client

Approvals are taken through Formal Sign-off Meetings. The BA presents the finalized requirements (BRD/SRS). Clients provide approval via:

- Digital Signature/Email Confirmation: Explicitly stating "Approved" for the documented scope.
- Phase-Gate Review: In Waterfall, the project cannot move from "Analysis" to "Design" until the client signs off on the requirements phase.

6. What Communication Channels to Establish and Implement

- Status Meetings: Weekly syncs with the project team.
- Steering Committee Meetings: Monthly high-level updates for C-level stakeholders.
- Repository/Shared Drive: A central location (e.g., SharePoint or Confluence) for all signed-off documentation.
- Email: For formal communication, meeting minutes, and change request logs.
- Instant Messaging (Slack/Teams): For quick, informal day-to-day queries between the BA and Dev team.

7. How to Handle Change Requests (CR)

1. CR Intake: Stakeholder submits a request for a change in scope (e.g., adding an 11th feature).
2. Impact Analysis: The BA assesses the impact on cost, time, and quality.
3. CCB Review: The request is presented to the Change Control Board.
4. Decision: The CCB either Approves, Rejects, or Defers the request.
5. Implementation: If approved, the BRD/SRS and RTM are updated, and the new requirements are baseline.

8. How to Update the Progress of the Project to Stakeholders

- Status Reports: Periodic reports highlighting "Planned vs. Actual" progress.
- Dashboards: Visual representation of project health (Green/Amber/Red status).
- Milestone Achievement Notifications: Formally notifying stakeholders when a phase (like "Design") is completed.

9. How to Take Sign-off on the UAT-Client Project Acceptance Form

1. UAT Execution: Clients test the 10 features against the predefined Test Cases derived from Use Cases.
2. Defect Management: Any bugs found are logged, fixed, and retested.
3. Acceptance Meeting: Once all "Critical" and "High" defects are closed, the BA presents the results.
4. Form Execution: The client signs the Project Acceptance Form, confirming the system meets the requirements and is ready for "Go-Live."

Document 3- Functional Specifications

Project Name	B2B Customer Issue Resolution Platform		
Customer Name	ResolveSphere		
Project Version	V 1.0 (Waterfall Phase)		
Project Sponsor	ResolveSphere		
Project Manager	Akash Naik		
Project Initiation Date	March 17, 2026		
Req ID	Req Name	Req Description	Priority
FR-01	Multi-Channel Support	The system shall provide a unified interface to handle B2B queries via chat, email, and video conferencing for real-time interaction.	High (10)
FR-02	Case Management	The system shall track customer issues from inception to final resolution, maintaining a complete audit trail and case history.	High (10)
FR-03	RCA Engine	The system shall utilize internal data tools to analyze issues, identify root causes, and suggest corrective actions for faster resolution.	Medium (7)
FR-04	JIRA Integration	The system shall automatically create and synchronize development tickets with the JIRA platform for technical issues or enhancements.	High (10)

Document 4- Requirement Traceability Matrix

[Link to the RTM Sheet](#)

To ensure 100% accountability throughout the project lifecycle, the project team will utilize a Traceability Mapping Reference for all functional requirements. This standardized string serves as a "breadcrumb" to provide bidirectional transparency between the Business Analyst, Technical Lead, and Testing Team.

Purpose and Accountability:

- **Auditability:** The string identifies the exact document version and page number where a requirement originated, ensuring the Accountable (A) party can verify compliance.
- **Technical Ownership:** It identifies the repository path and the specific Responsible (R) handler (e.g., Debal Adhikari) for each requirement.
- **Resolution Efficiency:** During User Acceptance Testing (UAT), if a defect is identified, the Consulted (C) and Informed (I) stakeholders can immediately reference the original functional description to clarify expected behavior and expedite resolution.

Mapping String Standard:

Every entry in the Requirement Traceability Matrix (RTM) must adhere to the following governance format:

[Document_ID_vX.X] / [Requirement_Name] / [Page_Reference] / [Technical_Path] / [Handler_ID (Name)] / [Date]

Example:

Component	String name	Description
Document Reference	FRD_Omnichannel_Interface_v1.0.docx	The specific Functional Requirement Document and version.
Requirement Name	Unified Multi-Channel Gateway	The functional name of the requirement being traced.
Location/Page	Pages 4-6	The exact location within the source document for quick auditing.
Technical Path	\\shared\\Engagement\\design	The file server or repository path where the Design Artifacts are stored.

Owner/Handler	BA_001 (Debal Adhikari)	The unique ID and name of the Business Analyst responsible for this requirement.
Timestamp	2026-03-15	The date the requirement was last validated or baselined in the matrix.

**ResolveSphere – B2B Customer Issue Resolution
Platform**

RS-2026-001

4. Introduction

4.1. Business Goals

Organization Goals:

- Operational Excellence: To transition from a reactive, manual support model to a proactive, automated system that minimizes Mean Time to Resolution (MTTR).
- Customer Centricity: To enhance the B2B client experience by providing transparent, real-time visibility into issue tracking and resolution status.
- Scalability: To build a robust support infrastructure that can handle increasing ticket volumes as the organization grows, without a linear increase in headcount.
- Technical Synergy: To foster seamless collaboration between Support, Product, and Engineering teams through integrated toolsets (JIRA/ReTool).

Organization Need:

The organization currently faces a critical "Visibility and Efficiency Gap." With B2B support handled through fragmented channels, there is no single source of truth for customer issues. This leads to information being "lost in transition" between support agents and developers.

Need:

- Centralization: A unified platform to eliminate data silos and fragmented communication across email, chat, and video.
- Automation: A mechanism to remove human error from technical handovers (specifically JIRA ticket creation).
- Intelligence: A requirement for data-driven insights through a Root Cause Analysis (RCA) engine to prevent recurring technical failures.
- Stakeholder Transparency: A dedicated interface to keep high-level B2B stakeholders informed, thereby protecting brand reputation and contract renewals.

4.2. Business Objectives

The software will be developed to include the following core functionalities:

- Multi-Channel Customer Support: Developing a unified communication gateway that integrates real-time chat, email, and video conferencing to facilitate immediate interaction with B2B stakeholders.
- Centralized Case Management System: Building an end-to-end tracking module that records every customer issue from the moment of inception through to final

resolution, providing a complete audit trail.

- Root Cause Analysis (RCA) Engine: Implementing an analytical layer that leverages historical and real-time data to identify underlying technical patterns and suggest preventative measures.
- Automated JIRA Ticket Integration: Developing a bidirectional sync between the support platform and engineering workflows to automate the creation and tracking of development tickets.

4.3. Business Rules

The ResolveSphere B2B CRM platform must adhere to the following organizational policies, procedures, and regulatory requirements to ensure consistent operations and compliance.

Rule Category	Rule Description
SLA Compliance	All "High" priority B2B tickets must be acknowledged within 15 minutes and assigned to a support specialist within 30 minutes.
Escalation Policy	Any case remaining in an "Open" status for more than 1 business day without a developer update must be automatically escalated to the Support Operations Head.
Data Privacy (PII)	Support agents are strictly prohibited from storing sensitive client credentials or personal PII (Personally Identifiable Information) within the Case Management comments.
Audit Readiness	Every status change in a support ticket must record a timestamp, the ID of the person making the change, and a mandatory reason code for the transition.
Engineering Handoff	A JIRA ticket can only be auto-created if the support case has passed the "Initial Screening" and "Reproduction" steps in the internal workflow.
Stakeholder Comms	C-level stakeholders must receive an automated "Weekly Insight Report" every Friday at 5:00 PM local time via the platform.
RCA Documentation	A formal Root Cause Analysis (RCA) report is mandatory for any system downtime event exceeding 60 minutes.
Security Protocol	Access to the Internal Tool Data (ReTool) is restricted to users with "Senior Support Specialist" roles or higher, authenticated

	via Single Sign-On (SSO).
Training Mandate	No support agent shall be granted "Write" access to the production environment until they have completed the "ResolveSphere Certification" module in the Training Portal.
Feedback Loop	Upon the closure of every B2B case, the system must trigger a Customer Satisfaction (CSAT) survey; results below 3/5 must trigger an automatic management review.

4.4. Background

Project Origin and Proposal:

The ResolveSphere project was proposed as a result of an internal operational audit of the team's support lifecycle. As the organization expanded its B2B client base, the existing "tribal knowledge" and manual-intensive processes began to show signs of strain. Leadership identified that while individual support agents were highly skilled, the lack of a centralized system was preventing the department from scaling efficiently. This led to a formal proposal for a unified B2B CRM and resolution platform to move from fragmented tools to a consolidated IT solution.

Business Issues & Problems Identified:

The initiation of this project was driven by several critical pain points identified during the "As-Is" process analysis:

- Fragmentation: Client interactions were scattered across personal emails and standalone chat applications, leaving no centralized audit trail for complex B2B cases.
- The "Black Hole" Effect: High-level stakeholders and C-level clients often had no visibility into the progress of their technical issues, leading to a perceived lack of accountability.
- Manual Handover Risks: The process of transferring issues from Support to Engineering was entirely manual. This resulted in significant "Technical Debt," frequent data entry errors in JIRA, and cases occasionally being "lost" between departments.
- Reactive Troubleshooting: Without integrated data from tools like ReTool, the team was forced to fix individual symptoms repeatedly rather than identifying and solving the root cause of systemic issues.

Expected Benefits of Implementation:

Developing B2B CRM Platform is expected to transform the organization's support

capabilities by delivering the following benefits:

- **Reduced MTTR:** By automating JIRA synchronization and centralizing communication, the organization expects a 20% reduction in Mean Time to Resolution.
- **Enhanced Transparency:** Real-time dashboards will provide stakeholders with immediate updates, improving client retention and professional trust.
- **Proactive Resolution:** The integrated RCA Engine will allow the team to identify patterns in operational data, reducing the overall volume of recurring tickets.
- **Operational Scalability:** A centralized Knowledge Base and automated workflows will reduce the onboarding time for new hires and allow the team to handle a larger volume of B2B clients without a proportional increase in costs.

4.5. Project Objective

Overall Goal:

The primary goal of the ResolveSphere project is to develop and deploy a comprehensive, centralized B2B Customer Issue Resolution Platform that replaces fragmented manual support processes with a structured, automated IT solution. This goal is centered on improving operational efficiency, ensuring data integrity across departments, and providing high-level stakeholders with a "single pane of glass" view into customer issue lifecycles.

High-Level Product Description:

ResolveSphere's B2B CRM Platform will act as a unified gateway for all B2B support interactions. The product will feature:

- **A Multi-Channel Interface** for immediate stakeholder engagement via chat, email, and video.
- **An Automated Case Management System** that tracks every issue from intake through root cause analysis to final resolution.
- **Intelligent Backend Integration** that synchronizes support data with engineering workflows to eliminate manual handover bottlenecks.
- **Analytical Dashboards** that transform raw support data into actionable performance metrics (KPIs) for management.

Alignment to Business Objectives:

The product's features are directly mapped to the organization's strategic business objectives:

- Reduced MTTR: By integrating JIRA and the RCA engine, the product directly fulfills the objective of reducing resolution time by 20%.
- Operational Scalability: The Knowledge Base and Training portal fulfill the objective of reducing new hire onboarding time and team backlog.
- Stakeholder Retention: The Reporting Dashboard and Multi-channel support fulfill the objective of providing transparency to C-level stakeholders, directly supporting the goal of long-term client retention.

Requirements for Interaction with Other Systems:

To function as a centralized hub, ResolveSphere requires seamless bidirectional communication with the following existing systems:

- JIRA (Atlassian): A robust API integration is required to automatically push support cases as development tickets and pull real-time status updates back into the ResolveSphere dashboard.
- ReTool: A data-level integration is required to fetch operational logs and internal technical data for the Root Cause Analysis (RCA) engine.
- Communication Gateways: The system must interface with SMTP servers for email and WebRTC protocols for integrated video conferencing.
- Identity Provider (SSO): Integration with the organization's Single Sign-On system is required to ensure secure, role-based access for support specialists and managers.

4.6. Project Scope

The project scope defines the boundaries of the ResolveSphere platform. It details the specific functionalities that will be designed, developed, and tested within the 6-month Waterfall lifecycle, as well as those that are explicitly excluded to prevent scope creep.

4.6.1. In-Scope Functionality

The current project focuses on building a centralized hub for B2B support. The following functionalities are included in the development phase:

- Integrated Multi-Channel Gateway: Development of a unified interface for chat, email, and WebRTC-based video conferencing.
- End-to-End Case Management: A system to track ticket status from "New" to "Closed" with a full audit trail of all agent actions.
- Automated JIRA Sync: A bidirectional API integration that creates JIRA tickets from support cases and updates case status based on engineering progress.
- RCA Analytical Engine: Logic that identifies patterns in recurring issues and suggests root causes based on historical data.

- Internal Data Extraction (ReTool): Secure connectors to pull operational and technical logs from ReTool for troubleshooting.
- Centralized Knowledge Base: A searchable CMS (Content Management System) for hosting product manuals and troubleshooting SOPs.
- Performance Analytics Dashboards: Real-time visualization of KRAs and KPIs, such as Mean Time to Resolution (MTTR) and backlog volume.
- Role-Based Access Control (RBAC): Secure login and permission levels integrated with the organizational Single Sign-On (SSO).
- Automated Stakeholder Reporting: A module to generate and schedule weekly progress reports for C-level clients.
- Internal Training Portal: A dedicated space for onboarding new hires and peer-to-peer knowledge sharing.

4.6.2. Out-of-Scope Functionality

To ensure project delivery within the allocated Rs. 8,00,000.00 budget and 6-month timeline, the following are not included in this phase:

- Mobile Application: Development of native iOS or Android apps is excluded; the platform will be web-based only.
- Direct Billing/Invoicing Integration: Financial transactions and client billing modules are outside the current scope.
- AI Chatbots (Automated Resolution): While the system provides a chat interface, AI-driven automated response/resolution (bots) is not part of this release.
- Third-Party CRM Integration: Integration with external CRMs like Salesforce or HubSpot (other than the internal JIRA/ReTool environment) is excluded.
- Legacy Data Migration: Migration of archived support data older than 2 years into the new platform is not included.
- Hardware Procurement: The physical purchase of laptops or servers is part of the budget but the actual procurement process is handled by the IT Procurement team, not the development project.

5. Assumptions

Based on the project scope and the technical environment, the following assumptions apply:

- API Availability: It is assumed that JIRA and ReTool provide accessible and stable REST APIs with the necessary documentation to support bidirectional data synchronization.
- Stakeholder Participation: It is assumed that key stakeholders (C-level clients

and Lead Engineers) will be available for elicitation sessions and timely sign-offs during the 6-month timeline.

- **Infrastructure Readiness:** It is assumed that the internal IT team will provide the necessary server environments (Development, Staging, and Production) as per the project schedule.
- **Data Integrity:** It is assumed that the legacy data within the support team's current manual logs is sufficiently structured to be mapped to the new Case Management schema.
- **Resource Consistency:** It is assumed that the core project team (PM, BA, and Developers) will remain dedicated to this project for the entire duration to avoid knowledge loss.
- **User Competency:** It is assumed that the support agents have a basic technical understanding of JIRA and browser-based interfaces, requiring training only on the new ResolveSphere B2B CRM Platform-specific features.
- **Network Stability:** It is assumed that the organization's network infrastructure supports the bandwidth required for the integrated video conferencing (WebRTC) functionality.
- **Compliance Alignment:** It is assumed that the current organizational security policies allow for the automated extraction of data from ReTool into a third-party resolution platform.

6. Constraints

The ResolveSphere project must be executed within the following set of fixed boundaries. These constraints represent the non-negotiable limitations on the project team's options regarding time, budget, and technical implementation.

- **Time Constraint:** The project is strictly bound to a 6-month Waterfall lifecycle. All phases—from Requirements Elicitation to User Acceptance Testing (UAT)—must be completed within this window to meet the scheduled "Go-Live" date.
- **Financial Constraint:** The total project budget is capped at Rs. 8,00,000. This includes all costs related to professional labor, software licensing, hardware, and research.
- **Methodological Constraint:** The project must adhere to the Waterfall Model. This requires a sequential progression where each phase must be formally signed off before the next begins, specifically preventing development from starting before the BRD and SRS are baselined.
- **Technical Compatibility:** The platform must maintain 100% compatibility with the existing versions of Atlassian JIRA and ReTool APIs. Any deviation would require a change request and reassessment of the technical scope.

- **Infrastructure Limitation:** The solution must be a web-based application accessible via standard corporate browsers (Chrome/Edge). There is no scope for native mobile or desktop application development in this phase.
- **Resource Availability:** The project must be delivered using the currently assigned team of specialized personnel (Project Manager, BA, Developers, and Testers). No additional human resource allocation is permitted.
- **Data Residency & Security:** All data processing and storage must comply with existing organizational Data Privacy Policies, ensuring that integration with JIRA does not violate internal security protocols.
- **Operational Language:** All system interfaces, Knowledge Base documentation, and automated reports must be developed exclusively in English for B2B client standardization.

7. Risk Analysis

This section identifies potential internal and external factors that could impact the successful delivery of ResolveSphere. Risks are analyzed based on Likelihood, Cost (Impact), and the specific Management Strategy adopted to minimize their effect on the 6-month Waterfall timeline.

7.1. Technological Risks

This subsection specifies new technology issues that could affect the project.

- **Risk:** API Incompatibility or Version Mismatch. The integration with JIRA or ReTool may fail if their external API schemas are updated during our development phase.
- **Likelihood:** Medium
- **Cost:** High
- **Strategy (Mitigate):** Conduct early "Proof of Concept" (PoC) testing with current API versions and establish a technical communication bridge with the DevOps team to monitor external updates.

7.2. Skills Risks

This subsection specifies the risk of not getting staff with the required expertise for the project.

- **Risk:** Specialized Integration Expertise Gap. The project requires developers proficient in bidirectional WebRTC (for video) and REST API synchronization for JIRA.
- **Likelihood:** Low

- Cost: Medium
- Strategy (Avoid): Perform a skills audit during the project initiation phase and provide targeted "up-skilling" sessions or documentation access to the development team immediately.

7.3. Political Risks

This subsection identifies political forces that could derail or affect the project.

- Risk: Inter-Departmental Friction. Engineering teams may perceive the automated JIRA integration as an "intrusion" into their existing workflow management, leading to low adoption.
- Likelihood: Medium
- Cost: Medium
- Strategy (Mitigate): Include Engineering Leads in the early Elicitation and Design phases to ensure the tool complements their workflow rather than complicating it.

7.4. Business Risks

This subsection describes the business implications if the project is canceled.

- Risk: Project Cancellation. If the project is halted, the organization continues to suffer from high MTTR and fragmented support.
- Likelihood: Low
- Cost: Very High
- Strategy (Accept): The organization accepts that cancellation would result in the loss of the Rs. 8,00,000 investment and potential churn of high-value B2B clients due to continued poor support visibility.

7.5. Requirements Risks

This subsection describes the risk that requirements have not been correctly captured.

- Risk: Inaccurate Root Cause Analysis (RCA) Logic. The logic for identifying "Root Causes" may be incorrectly captured, leading to false insights.
- Likelihood: Medium
- Cost: Medium
- Strategy (Mitigate): Use the Requirements Traceability Matrix (RTM) to ensure every RCA business rule is mapped to a specific test case and validated during UAT.
- Most Likely Areas of Error: Automated JIRA field mapping and the ReTool data extraction logic.

7.6. Other Risks

Document any other risks not covered in the prior subsections.

- Risk: Stakeholder Availability for Sign-off. In a Waterfall model, delays in C-level stakeholders signing off on the BRD will delay the entire Design and Development schedule.
- Likelihood: High
- Cost: High
- Strategy (Transfer): Escalate the sign-off schedule to the Project Sponsor to ensure that executive-level pressure maintains the 6-month project timeline.

8. Business Process Overview

This section defines the transition of the B2B support lifecycle from its current manual state to the integrated ResolveSphere platform. It outlines the sequence of activities and the shift in operational logic required to meet the project's success criteria.

8.1. Legacy System (AS-IS)

Process Explanation:

In the current "As-Is" state, the support process is highly fragmented and dependent on manual intervention at every stage.

- Intake: B2B queries arrive via multiple, disconnected channels (personal emails, various Slack channels, or direct calls).
- Tracking: There is no centralized case ID; agents often track issues using local spreadsheets or "tribal knowledge."
- Technical Handoff: When a bug is identified, the agent must manually log into JIRA, copy-paste details, and create a ticket. This often leads to missing technical logs or incorrect priority labeling.
- Reporting: Stakeholders are updated manually via email threads, often resulting in delayed information and a lack of real-time visibility.

8.2. Proposed Recommendations (TO-BE)

Recommended Process Description:

The "To-Be" process introduces a centralized hub that automates the flow of information.

1. Unified Intake: All queries are routed through the ResolveSphere Multi-Channel Gateway, automatically generating a unique Case ID.
2. Automated RCA: The system pulls data from ReTool immediately upon case

- creation, providing the agent with a preliminary Root Cause Analysis.
3. Synchronized Integration: If the issue is technical, the JIRA Integration automatically creates a linked developer ticket, ensuring 100% data integrity and bidirectional status updates.
 4. Proactive Transparency: C-level stakeholders access a real-time Insights Dashboard, eliminating the need for manual status emails.

Addressing Legacy Challenges:

- 1st Challenge (Silos): Addressed by the Case Management System, which provides a single source of truth for all interactions.
- 2nd Challenge (Manual Errors): Addressed by Automated JIRA Sync, which ensures technical data is transferred accurately without human intervention.
- 3rd Challenge (Information Black Hole): Addressed by the Reporting & Insights Dashboard, providing 24/7 visibility to executive stakeholders.
- 4th Challenge (Slow Onboarding): Addressed by the Knowledge Base & Training Portal, which standardizes troubleshooting steps for new hires.

9. Business Requirements

This section outlines the specific requirements elicited from B2B stakeholders, support leads, and the engineering team. To ensure the "nurturing process" of the requirements remains Correct, Complete, and Consistent, they are categorized by functional area and prioritized using the MoSCoW method (Must have, Should have, Could have, Won't have).

Functional Requirements

Req ID	Requirement Area	Requirement Description	Priority
BR-F01	Communication	Unified Multi-Channel Gateway for Chat, Email, and WebRTC Video.	Must Have
BR-F02	Case Management	Automated Case ID generation and lifecycle tracking (New to Closed).	Must Have
BR-F03	Integration	Bidirectional sync with JIRA for automated ticket creation and updates.	Must Have
BR-F04	Analytics	Root Cause Analysis (RCA) engine extracting data from ReTool.	Should Have
BR-F05	Knowledge	Centralized, searchable repository for SOPs	Must Have

		and troubleshooting guides.	
BR-F06	Reporting	Real-time Dashboard for KRA/KPI monitoring (MTTR, Backlog).	Must Have
BR-F07	Collaboration	Peer-to-peer training portal and doubt-clearing module.	Should Have
BR-F08	Optimization	Automated identification of workflow bottlenecks and process suggestions.	Could Have

Non-Functional Requirements (FURPS Model)

Category	Requirement Description
Functionality	The system must support role-based access control (RBAC) via Single Sign-On (SSO).
Usability	The interface must allow an agent to create a JIRA-linked case in under 3 clicks.
Reliability	The platform must maintain 99.9% uptime during B2B core business hours.
Performance	Dashboard data and RCA insights must refresh in under 5 seconds.
Supportability	The system must be web-based and compatible with the latest versions of Chrome and Edge.

Requirements Traceability Matrix (RTM) Reference

To ensure every requirement listed above is developed and tested, all items have been mapped to the Requirement Traceability Matrix. This allows the project team to track each requirement from the BRD through to Design (D1/D2), Testing (T1/T2), and final User Acceptance Testing (UAT).

Reference Material:

- Use Case Documentation
- UI/UX Wireframes (Activity Diagram)
- API Specification (System Design Document)

10. Appendices

The appendices serve as a reference guide to ensure that all technical, business, and project-specific terminology is interpreted consistently by all stakeholders, from C-level executives to the engineering team.

10.1. List of Acronyms

Acronym	Full Form
API	Application Programming Interface
BA	Business Analyst
BRD	Business Requirements Document
CCB	Change Control Board
CRM	Customer Relationship Management
FURPS	Functionality, Usability, Reliability, Performance, Supportability
JIRA	Issue and Project Tracking Software (Atlassian)
KPI	Key Performance Indicator
KRA	Key Responsibility Area
MTTR	Mean Time to Resolution
RCA	Root Cause Analysis
RTM	Requirement Traceability Matrix
SLA	Service Level Agreement
SRS	Software Requirements Specification
UAT	User Acceptance Testing
UML	Unified Modeling Language

10.2. Glossary of Terms

- As-Is Process: The current state of business operations before any changes or improvements are implemented.
- Baseline: A validated and approved version of a document or software that serves as the basis for further development.
- Case Management: The process of opening, tracking, managing, and closing customer support issues.
- MoSCoW: A prioritization technique used in requirements management (Must have, Should have, Could have, Won't have).

- ReTool: An internal platform used for building custom business tools and accessing operational data.
- Stakeholder: Any individual, group, or organization that can affect or be affected by the project.
- To-Be Process: The optimized future state of business operations after the implementation of the project.
- Waterfall Model: A sequential project management methodology where each phase must be completed before the next begins.
- WebRTC: A technology that enables web browsers and mobile applications with real-time communication capabilities (Video/Voice).

10.3. Related Documents

The following documents provide additional context and technical detail for the ResolveSphere project:

- Project Charter: The formal document that authorized the project and defined high-level goals.
- Software Requirements Specification (SRS): Detailed functional and technical requirements derived from this BRD.
- System Design Document (SDD): Architectural and database design specifications for the developers.
- User Acceptance Test (UAT) Plan: The strategy and test cases used to validate the system before Go-Live.
- Requirement Traceability Matrix (RTM): The tracking sheet ensuring all requirements are built and tested.
- Change Request Log: The historical record of all approved changes to the project scope
